

MULTIMONITOR

AUTOMATED MONITORING AND ALARM SYSTEM

MULTIMONITOR is essential software for supervision of DAB multiplexes. Be the first to know and troubleshoot any service disruption through live status indicators and instant email alerts.

Multiple DAB channels are monitored in a single display, making this a highly expansive platform for both small-scale and national broadcasters, and regulatory agencies.

Decoding all or a selection of subchannels in a DAB multiplex allows the operator to verify the on-air content; **VU meters** for audio presence and level checking, **audio layout**, **DLS/DL+** and **slideshow display** ensures each service is of highest quality for listeners.

Detailed reporting of availability data, error statistics and service configurations are provided through a **comprehensive logging database** which can be specified through simple component, status, and time/date filters.

TECHNICAL SPECIFICATIONS

Operating System	CPU	Memory	Storage
Windows 10 Pro	Intel Core i5 processor - 2GHz or faster	8GB RAM	2GB free disk capacity for installation

FEATURES

-  Live audio and PAD display
-  Instant group email notifications
-  Audio silence for individual services
-  Frame rate and continuity counter
-  PAD silence and MOT/DLS stall alerts
-  Configuration history logs
